

Heat Shield – Rear of Appliance

(reduces rear clearance as per tested results – See install manual).

Heat Shield accessory to be used in conjunction with a flue mounted heat shield. Included:

1 x heatshield

6 x self tapping machine screws

6 x 25mm spacers

Use the heat shield as a template, position flush with the top of the heater, mark and punch each hole on the back of the heater. Use a pilot hole drill to cut each hole, then fix the shield using the self-tapping machine screws through the heatshield and the 25mm spacers provided. The machine screws can cut the hole but pre-drilling a pilot hole makes the job a lot easier.

The flue mounted shield must be fitted to the first 900mm of flue, as per shield manufacturer's instructions.
